

In the CLAIMS

Please replace claims 1-9 filed with the original submission by the inventor on November 20, 2001 with new claims 10-18 previously submitted in the response filed March 12, 2004 and resent July 9, 2004 and enclosed again herein for clarity.

Claims 1-9 - Cancelled

10. (Previously submitted) A load supporting bracket adapted for attaching to a substantially vertical member having a depth defined by front face and a back face, comprising:

a side member having front and rear ends;

a front leg and a rear leg co-protruding from the front and rear ends of the side member respectively and forming a first opening greater than the depth of the vertical member therebetween; and

a support member extending from the front end of the side member and adapted for supporting a load, the bracket having an installation position wherein the first opening is oriented for installation laterally onto the vertical member and the bracket having a supporting position wherein the bracket is rotated to lower the support member until the front leg engages the front face of the vertical member and the rear leg engages the rear face of the vertical member.

11. (Previously submitted) The support bracket of claim 10 wherein the front and rear legs are L-shaped, each of the front and rear legs further comprising:

a transverse member protruding substantially perpendicular from the side member; and

a tab projecting substantially perpendicular from the transverse member and over the first opening, the tabs having a limited length so to form a second opening therebetween which is greater than the depth of the vertical member and which has a lesser extent than the first opening so that

in the installation position, the second opening is oriented for installation laterally onto the vertical member and

in the supporting position and the front leg and rear legs engage vertical member, the tabs partially envelope the vertical member.

12. (Previously submitted) The support bracket of claim 10, further comprising:

anchors extending towards the first opening from at least one of the front leg or the rear leg for engaging the vertical member in the supporting position and substantially precluding relative movement of the bracket and vertical member when the support member is loaded.

13. (Previously submitted) The support bracket of claim 12 wherein the anchor comprises one or more teeth.

14. (Previously submitted) The support bracket of claim 10 wherein the support member is a hook.

15. (Previously submitted) A system implementing the support bracket of claim 10 further comprising:

two brackets adapted for attaching to two spaced apart and substantially parallel vertical members;

an axle adapted for extending between the support members of each bracket; and

a material reel rollably mounted on the axle for ease of dispensing of the material.

16. (Previously submitted) A system implementing the support bracket of claim 10 further comprising:

two brackets adapted for attaching to two spaced apart and substantially parallel vertical members;

a work surface extending between the support members of each bracket.

17. (Previously submitted) The support bracket of claim 10 wherein the support member further comprises a plurality of rollers for forming a substantially frictionless support surface for a load movable in a direction transverse to the side member.

18. (Previously submitted) A system implementing the support bracket of claim 17 further comprising:

a coil of materials; and

two brackets adapted for attaching to two locations spaced apart vertically on the vertical members to support the coil, one with the rollers forming an upward support surface and one with the rollers forming an downward support surface.
